HCI/CprE/ComS 575: Computational Perception Homework 1 (part 1) Out: Thursday Jan 11, 2018 Due: Thursday Jan 25, 2018

For extra credit submit part 1 (only part 1) by Saturday Jan 13 before 4pm. (submit a scanned copy, or cellphone pictures of your pages, via e-mail to the instructor)

Note: Not all homeworks are created equal :(

These problems are designed to test your background knowledge in linear algebra and math in general. Please show the intermediary steps of your calculations (not just the final answers).

1. Calculate the following determinants.

$$(a) \begin{vmatrix} 3 & 5 \\ -2 & 4 \end{vmatrix} (b) \begin{vmatrix} \alpha - 6 & 8 \\ -2 & \alpha - 4 \end{vmatrix} (c) \begin{vmatrix} 3 & 0 & 0 \\ 2 & -1 & 5 \\ 1 & 9 & -4 \end{vmatrix} (d) \begin{vmatrix} -2 & 7 & 6 \\ 5 & 1 & -2 \\ 3 & 8 & 4 \end{vmatrix}$$

2. Show that the value of the determinant does not depend on θ .

sin heta	cos heta	0
$-cos\theta$	sin heta	0
$sin\theta - cos\theta$	$sin\theta + cos\theta$	1

3. Calculate the inverse of the given matrix.

$$(a) \quad \begin{bmatrix} 3 & 1 \\ 5 & 2 \end{bmatrix} \quad (b) \quad \begin{bmatrix} 2 & 6 & 6 \\ 2 & 7 & 6 \\ 2 & 7 & 7 \end{bmatrix} \quad (c) \quad \begin{bmatrix} 3 & 4 & -1 \\ 1 & 0 & 3 \\ 2 & 5 & -4 \end{bmatrix} \quad (d) \quad \begin{bmatrix} 0 & 0 & 0 & k_1 \\ 0 & 0 & k_2 & 0 \\ 0 & k_3 & 0 & 0 \\ k_4 & 0 & 0 & 0 \end{bmatrix}$$

4. Solve the following systems of equations.

5. Let u = (1, 2, -2), v = (3, 0, 1), and w = (1, 5, 4). Compute:

(a)
$$u \cdot v$$
 (b) $\|u\|$ (b) $v \times w$ (c) $u \times (v \times w)$ (d) $(u \times v) \times w$

6. Find the orthogonal projection of u on a (i.e., find $proj_a u = \frac{u \cdot a}{\|a\|^2} a$)

(a)
$$u = (-1, -2), a = (-2, 3)$$

(b) $u = (1, 0, 0), a = (4, 3, 8)$

7. Find the angle θ between the two vectors u and v.

(a)
$$u = (-6, -2), v = (4, 0)$$

(b) $u = (1, 0, 0), v = (1, 1, 0)$

8. Find an equation for the plane passing through the given points.

(a)
$$P(1,2,-1), Q(2,3,1), R(3,-1,2)$$
 (b) $P(5,4,3), Q(4,3,1), R(1,5,4)$

9. Find all values of λ for which the determinant of the matrix is equal to 0.

(a)
$$\begin{vmatrix} \lambda - 3 & 0 \\ 8 & \lambda + 1 \end{vmatrix}$$
 (b) $\begin{vmatrix} \lambda & 3 \\ 4 & \lambda \end{vmatrix}$ (c) $\begin{vmatrix} \lambda - 5 & 0 & 1 \\ 1 & \lambda - 1 & 0 \\ -7 & 1 & \lambda \end{vmatrix}$

10. Find the eigenvalues of the following matrices.

$$(a) \quad \left[\begin{array}{cc} -1 & 6 \\ 0 & 5 \end{array} \right] \quad (a) \quad \left[\begin{array}{ccc} 5 & 6 & 2 \\ 0 & -1 & -8 \\ 1 & 0 & -2 \end{array} \right] \quad (b) \quad \left[\begin{array}{ccc} 3 & 0 & 0 \\ -2 & 7 & 0 \\ 4 & 8 & 1 \end{array} \right]$$

- 11. Given the vector $v = [x, y]^T$ find a rotation matrix R which rotates the vector by 120° counterclockwise. Give the values for the vector $v' = [x', y']^T$ in terms of x and y, where v' = Rv.
- 12. Write down the analytical form of the 3D rotation matrices R_x , R_y , and R_z which rotate a vector about the X, Y, and Z axis, respectively.
- 13. By example, show that the 3D rotation matrices are not commutative.
- 14. Give the formula for the probability density function of the normal distribution. Do this for the 1D and the 2D case.
- 15. Prove the Pythagorean theorem in two different ways.
- 16. Give the formulas for the discrete Fourier transform and its inverse. Explain their meaning with one paragraph for each.

HCI/CprE/ComS 575: Computational Perception Homework 1 (part 2) Out: Thursday Jan 11, 2018 Due: Thursday Jan 25, 2018

The Matlab book, which is a required textbook for this class, shows several plot types on pages 170-174 (old edition of the book) or pages 184-188 (new edition).

Pick one plot type from each page and try to draw something similar, but it should not be the exact same plot as in the book. For each problem submit your matlab file and an output image. Name your files: myplot1.m, myplot2.m, ..., myplot5.m. Similarly, name your output images myoutput1.jpg, myoutput2.jpg, ..., myoutput5.jpg. (PNG or GIF file format is also acceptable).

Submit a ZIP file with all of your files to the TA.

HCI/CprE/ComS 575: Computational Perception Homework 1 (part 3) Out: Thursday Jan 11, 2018 Due: Thursday Jan 25, 2018

Solve 10 of the following 19 problems (see the following pages). You can pick any 10. Your grade will not depend on your problem selection. Submit a separate matlab file (and any supporting files if needed) for each problem. Name your files using the problem and page number. For example, your solution file for exercise 3 on page 84 should be named e3_page84.m

Submit a ZIP file with all of your files to the TA.

EXERCISES

1. Entering matrices: Enter the following three matrices.

$$A = \begin{bmatrix} 2 & 6 \\ 3 & 9 \end{bmatrix}, \qquad B = \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}, \qquad C = \begin{bmatrix} -5 & 5 \\ 5 & 3 \end{bmatrix}.$$

- 2. Check some linear algebra rules:
 - Is matrix addition commutative? Compute A+B and then B+A. Are the results the same?
 - Is matrix addition associative? Compute (A+B)+C and then A+(B+C) in the order prescribed. Are the results the same?
 - Is multiplication with a scalar distributive? Compute $\alpha(A+B)$ and $\alpha A + \alpha B$, taking $\alpha = 5$ and show that the results are the same.
 - Is multiplication with a matrix distributive? Compute A*(B+C) and compare with A*B+A*C.
 - Matrices are different from scalars! For scalars, ab = ac implies that b = c if $a \neq 0$. Is that true for matrices? Check by computing A*B and A*C for the matrices given above.

In general, matrix products do not commute either (unlike scalar products). Check if A*B and B*A give different results.

3. Create matrices with zeros, eye, and ones: Create the following matrices with the help of the matrix generation functions zeros, eye, and ones. See the on-line help on these functions, if required (e.g., help eye).

 $D = \begin{bmatrix} 0 & 0 & 0 \\ \bar{0} & 0 & 0 \end{bmatrix}, \quad E = \begin{bmatrix} 5 & 0 & 0 \\ 0 & 5 & 0 \\ 0 & 0 & 5 \end{bmatrix}, \qquad F = \begin{bmatrix} 3 & 3 \\ 3 & 3 \end{bmatrix}.$

4. Create a big matrix with submatrices: The following matrix G is created by putting matrices A, B, and C, given above, on its diagonal. In how many ways can you create this matrix using submatrices A, B, and C (that is, you are not allowed to enter the non-zero numbers explicitly)?

1	2	6	0	0	0	0	
<i>G</i> =	3	9	0	0	0	0	
	0	0	1	2	0	0	
	0	0	3	4	0	0	·
	0	0	0	0	-5	5	
	0	0	0	0	5	3	

- 5. Manipulate a matrix: Do the following operations on matrix G created above in (4).
 - Delete the last row and last column of the matrix.
 - Extract the first 4×4 submatrix from G.
 - Replace G(5,5) with 4.
 - What do you get if you type G(13) and hit return? Can you explain how MATLAB got that answer?
 - What happens if you type G(12,1)=1 and hit return?

84

3.7 Plotting Simple Graphs

- 6. See the structure of a matrix: Create a 20×20 matrix with the command A=ones(20). Now replace the 10×10 submatrix between rows 6:15 and columns 6:15 with zeros. See the structure of the matrix (in terms of nonzero entries with the command spy(A). Set the 5×5 submatrices in the top right corner and bottom left corner to zeros and see the structure again.
- 7. Create a symmetric matrix: Create an upper triangular matrix with the following command:

$$A = diag(1:6) + diag(7:11,1) + diag(12:15,2).$$

Make sure you understand how this command works (see the on-line help on diag if required). Now use the upper off-diagonal terms of A to make A a symmetric matrix with the following command:

$$A = A + triu(A,1)'.$$

This is a somewhat *loaded* command. It takes the upper triangular part of A above the main diagonal, flips it (transposes), and adds to the original matrix A, thus creating a symmetric matrix A. See the on-line help on triu.

- 8. Do some cool operations: Create a 10×10 random matrix with the command A=rand(10). Now do the following operations.
 - Multiply all elements by 100 and then round off all elements of the matrix to integers with the command A=fix(A).
 - Replace all elements of A < 10 with zeros.
 - Replace all elements of A > 90 with infinity (inf).
 - Extract all $30 \le a_{ij} \le 50$ in a vector b, that is, find all elements of A that are between 30 and 50 and put them in a vector b.

9. How about some fun with plotting?

- Plot the parametric curve x(t) = t, $y(t) = e^{-t/2} \sin t$ for $0 < t < \pi/2$ using explot.
- Plot the cardioid $r(\theta) = 1 + \cos \theta$ for $0 < \theta < 2\pi$ using ezpolar.
- Plot the contours of $x^2 + \sin(xy) + y^2 z^2 = 0$ using ezcontour over the domain $-\pi/2 < x < \pi/2, -\pi/2 < y < \pi/2.$
- Create a surface plot along with contours of the function $H(x, y) = \frac{x^2}{2} + (1 \cos y)$ for $-\pi < x < \pi, -2 < y < 2$.

EXERCISES

1. A script file to compute sine series: Write a script file named sineseries.m that computes the value of sin(x) at a given x using n terms of the series expansion of the sine function:

$$\sin(x) = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \dots = \sum_{k=1}^n (-1)^{k-1} \frac{x^{2k-1}}{(2k-1)!}$$

Follow the steps given below.

- First, query MATLAB to see if the name *sineseries* is already taken by some variable or function with the command exist('sineseries'). What does the MATLAB response mean? [Hint, see on-line help on exist.]
- Include the following line as the header (H1 line) of your script file. %SINESERIES: computes sin(x) from series expansion Now code the formula so that it computes the sum of the series for a given scalar x and a given integer n.
- Save the file. Type help sineseries to see if MATLAB can access your script file. Now, compute $\sin(\pi/6)$ with n = 1, 5, 10, and 20. Compare the results. Do the same for some other x of your choice.
- 2. A function file to compute sine series: Take the script file written above and convert it into a function file using the following steps.
 - Name the function sine_series and modify the H1 line appropriately.
 - Let x and n be the input to your function and y (the sum) be the output.
 - Save the function and execute it to see that it works and gives the same output as the script file above.
 - Modify the function to include more on-line help on how to run the function.
 - Modify the function so that it can accept a vector x and give an appropriate y.
 - Modify the function to include a check on the input n. The function should proceed only if n > 0 is an integer, otherwise it should display an error message.
 - Provide for an optional output err, which gives the % error in y when compared to sin(x). [Hint: use conditional statement on nargout for optional output.]
 - Modify the function so that it takes a default value of n = 10 if the user does not specify n. [Hint: use nargin.]
 - Execute the function to check all features you have added.
- 3. A function as an input to another function: There are several ways in which a function can be passed in the input argument list of another function. The function to be used in the input list can be written as an inline function (see Section 3.4.1 on page 70) or it can be coded in a function file. How the function is passed in the input list depends on how it is coded.

Code the function $y(x) = \frac{\sin(x)}{x}$ as an inline function sinc and in a function file called sincfun.m. You will use this function in the input list of ezplot (see page 80 for ezplot) in various ways in the following instructions.

• Use the inline function sinc in the input list of ezplot to plot the function over the default domain.

C
 b
 D
 so
 it
 pi

 5. Profil€ taking

Recuration not the calculation

- Create a function handle for sincfun and use the handle in the input list of explot to plot the function over the default domain.
- 4. Write subfunctions: In this exercise you will write a simple function to find sin(x) and/or cos(x) from series expansion using two subfunctions—sine_series and cosine_series.
 - Write a function named cosine_series to evaluate the cosine series (follow Exercise 2 above)

$$\cos(x) = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \dots = \sum_{k=1}^n (-1)^{k-1} \frac{x^{2(k-1)}}{2(k-1)!}$$

Execute and test the function to make sure it works correctly.

- Write a new function named trigseries as follows.
 - The input list of the function should include x, n, and another string variable *options*. The user can specify 'sin', 'cos', or 'both' for *options*. The default should be 'both'. The output list should include y and *err*, as discussed in Exercise 2.
 - The function trigseries should call sine_series and cosine_series as appropriate to compute y and err, depending on what the user specifies in options. Implement this call sequence with switch using options as the switch.
 - Program the output y and err to be two column arrays if the user asks for 'both' in *options* or as the default.
- Copy and paste the functions sine_series and cosine_series as subfunctions below the function trigseries in the same file.
- Delete the original files sine_series2.m and cosine_series2.m or rename them something else. Test trigseries with various input and *options*. Make sure it works correctly. Now execute trigseries with only one input x=[0 pi/6 pi/4 pi/3 pi/2]. Do you get reasonable answers?
- 5. Profile a function: Profile the function trigseries, developed above in Exercise 4, taking a vector x of 100 equally spaced points between 0 and π as the only input.
- 6. Recursion: Write a function to compute n! using recursion. (Note that this is not the most efficient way to compute n!. However, it is conceptually a recursive calculation that is easy to implement and test recursion in MATLAB.)

EXERCISES

1. Linear algebraic equations: Find the solution of the following set of linear algebraic equations, as advised below.

 $\begin{array}{rcl} x+2y+3z &=& 1\\ 3x+3y+4z &=& 1\\ 2x+3y+3z &=& 2. \end{array}$

- Write the equation in matrix form and solve for $\mathbf{x} = [x \ y \ z]^T$ using the left division \backslash .
- Find the solution again using the function rref on the augmented matrix.
- Can you use the LU decomposition to find the solution? [Hint: Since [LU]x
 b, let [U]x = y, so that [L]y = b. Now, first solve for y and then for x.]
- 2. Eigenvalues and eigenvectors: Consider the following matrix.

	Γ3	-3	4
$\mathbf{A} =$	2	-3	4
	0	$^{-1}$	1

- Find the eigenvalues and eigenvectors of A.
- Show, by computation, that the eigenvalues of A² are square of the eigenvalues of A.
- Compute the square of the eigenvalues of A². You have now obtained the eigenvalues of A⁴. From these eigenvalues, can you guess the structure of A⁴?
 Compute A⁴. Can you compute A⁻¹ without using the inv function?
- 3. Linear and quadratic curve fits: The following data is given to you.

r	[0	0.15	0.2	0.30	0.4	0.52	0.6	0.70	0.8	0.90	1
\tilde{y}	=	0	1.61	2.2	3.45	4.8	6.55	7.8	9.45	11.2	13.05	15

- Enter vectors x and y and plot the raw data using plot(x,y,'o').
- Click on the figure window. Select Basic Fitting from the Tools menu of the figure window. Once you get the Basic Fitting window, check the box for linear fit. In addition, check the boxes for Show equations, Plot residuals (select a *scatter* plot rather than a *bar* plot option), and Show norm of residuals.
- Now, do a quadratic fit by checking the quadratic fit box and all other boxes as you did for the linear case.
- Compare the two fits. Which fit is better? There isn't really a competition, is there?
- 4. A nonlinear curve fit: Enter the following experimental data in MATLAB workspace.

$$t = [0 \ 1.40 \ 2.79 \ 4.19 \ 5.58 \ 6.98 \ 8.38 \ 9.77 \ 11.17 \ 12.57];$$

 $x = [0 \ 1.49 \ 0.399 \ -0.75 \ -0.42 \ 0.32 \ 0.32 \ -0.10 \ -0.21 \ 0];$

You are told that this data comes from measuring the displacement x of a damped oscillator at time instants t. The response x is, therefore, expected to have the following form:

$$x = Ce^{-\lambda_1 t} \sin(\lambda_2 t)$$

where the constants C, λ_1 , and λ_2 are to be determined from the experimental data. Thus, your job is to fit a curve of the given form to the data and find the constants that give the best fit.
