

CprE / ComS 583 Reconfigurable Computing

Prof. Joseph Zambreno
Department of Electrical and Computer Engineering
Iowa State University

Lecture #19 –VHDL for Synthesis II

Recap – Moore FSM Example

- Moore FSM that recognizes sequence “10”

Meaning of states:
S0: No elements of the sequence observed
S1: “1” observed
S2: “10” observed

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.2

Recap – Mealy FSM Example

- Mealy FSM that recognizes sequence “10”

Meaning of states:
S0: No elements of the sequence observed
S1: “1” observed

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.3

Moore FSM Example – VHDL

```

TYPE state IS (S0, S1, S2);
SIGNAL Moore_state: state;
  
```

```

U_Moore: PROCESS (clock, reset)
BEGIN
  IF(reset = '1') THEN
    Moore_state <= S0;
  ELSIF (clock = '1' AND clock'event) THEN
    CASE Moore_state IS
      WHEN S0 =>
        IF input = '1' THEN
          Moore_state <= S1;
        ELSE
          Moore_state <= S0;
        END IF;
    END CASE;
  END IF;
END PROCESS;
  
```

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.4

Moore FSM Example – VHDL (cont.)

```

    WHEN S1 =>
      IF input = '0' THEN
        Moore_state <= S2;
      ELSE
        Moore_state <= S1;
      END IF;
    WHEN S2 =>
      IF input = '0' THEN
        Moore_state <= S0;
      ELSE
        Moore_state <= S1;
      END IF;
    END CASE;
  END IF;
END PROCESS;

Output <= '1' WHEN Moore_state = S2 ELSE '0';
  
```

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.5

Mealy FSM Example – VHDL

```

TYPE state IS (S0, S1);
SIGNAL Mealy_state: state;
  
```

```

U_Mealy: PROCESS(clock, reset)
BEGIN
  IF(reset = '1') THEN
    Mealy_state <= S0;
  ELSIF (clock = '1' AND clock'event) THEN
    CASE Mealy_state IS
      WHEN S0 =>
        IF input = '1' THEN
          Mealy_state <= S1;
        ELSE
          Mealy_state <= S0;
        END IF;
    END CASE;
  END IF;
END PROCESS;
  
```

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.6

Mealy FSM Example – VHDL (cont.)

```

WHEN S1 =>
  IF input = '0' THEN
    Mealy_state <= S0;
  ELSE
    Mealy_state <= S1;
  END IF;
END CASE;
END IF;
END PROCESS;

Output <= '1' WHEN (Mealy_state = S1 AND input = '0') ELSE '0';

```

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.7

Finite State Machine Design

- A more “fair” bus arbiter
 - 5 resources contending for the bus
 - Inputs r1 -> r5, Outputs g1 -> g5
 - Tuesday's arbiter
 - Resource r(i) has precedence over r(j>i) when bus is idle
 - Once granted access, resources can hold on to the bus as long as they want to
 - Group 1 – same precedence, but now resource r(i) can only have bus for i cycles at a time
 - Group 2 – if multiple requests for bus, tie goes to least recently used resource
 - Group 3 – each resource can also “interrupt” the bus if necessary and gain instant access

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.8

Outline

- Recap
- Memories
 - Modeling RAM
 - Modeling ROM
- Writing Synthesizable Code
- Additional VHDL Features
 - Functions
 - Procedures
 - Attributes
 - Variables
 - Constants

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.9

Generic RAM

```

LIBRARY ieee;
USE ieee.std_logic_1164.all;

-----
ENTITY ram IS
  GENERIC (bits: INTEGER:=8; -- # of bits per word
           words: INTEGER := 16); -- # of words in the memory

  PORT (wr_ena, clk: IN STD_LOGIC;
        addr: IN INTEGER RANGE 0 to words-1;
        data_in: IN STD_LOGIC_VECTOR(bits -1 downto 0);
        data_out: OUT STD_LOGIC_VECTOR(bits - 1 downto 0)
        );
END ram;

```

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.10

Generic RAM (cont.)

```

ARCHITECTURE behavioral OF ram IS
  TYPE vector_array IS ARRAY (0 TO words-1) OF
    STD_LOGIC_VECTOR(bits - 1 DOWNTO 0);
  SIGNAL memory: vector_array;

BEGIN
  PROCESS(clk)
  BEGIN
    IF (wr_ena='1') THEN
      IF (clk'EVENT AND clk='1') THEN
        memory(addr) <= data_in;
      END IF;
    END IF;
  END PROCESS;
  data_out <= memory(addr);
END ram;

```

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.11

Generic ROM

```

LIBRARY ieee;
USE ieee.std_logic_1164.all;

-----
ENTITY rom IS
  GENERIC (bits: INTEGER:=8; -- # of bits per word
           words: INTEGER := 8); -- # of words in the memory

  PORT ( addr: IN INTEGER RANGE 0 to words-1;
        data: OUT STD_LOGIC_VECTOR(bits - 1 downto 0)
        );
END rom;

```

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.12

Constants

Syntax:

```
CONSTANT name : type := value;
```

Examples:

```
CONSTANT high : STD_LOGIC := '1';
CONSTANT datamemory : memory := ((X"00", X"02");
```

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.13

Constants – Features

- Constants can be declared in a PACKAGE, ENTITY, or ARCHITECTURE
- When declared in a PACKAGE, the constant is truly global, for the package can be used in several entities
- When declared in an ARCHITECTURE, the constant is local, i.e., it is visible only within this architecture
- When declared in an ENTITY, the constant can be used in all architectures associated with this entity

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.14

Generic ROM (cont.)

```
ARCHITECTURE behavioral OF rom IS
  TYPE vector_array IS ARRAY (0 TO words-1) OF
    STD_LOGIC_VECTOR(bits - 1 DOWNTO 0);
```

```
  CONSTANT memory: vector_array :=
    ("0000_0000",
     "0000_0010",
     "0000_0100",
     "0000_1000",
     "0001_0000",
     "0010_0000",
     "0100_0000",
     "1000_0000");
```

```
BEGIN
  data <= memory(addr);
END rom;
```

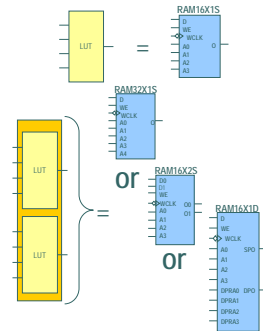

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.15

Distributed RAM

- CLB LUT configurable as Distributed RAM
 - A LUT equals 16x1 RAM
 - Implements Single and Dual-Ports
 - Cascade LUTs to increase RAM size
- Synchronous write
- Synchronous/Asynchronous read
 - Accompanying flip-flops used for synchronous read

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.16

RAM 16x1

```
library IEEE;
use IEEE.STD_LOGIC_1164.all;
```

```
library UNISIM;
use UNISIM.all;
```

```
entity RAM_16X1_DISTRIBUTED is
  port(
    CLK : in STD_LOGIC;
    WE : in STD_LOGIC;
    ADDR : in STD_LOGIC_VECTOR(3 downto 0);
    DATA_IN : in STD_LOGIC;
    DATA_OUT : out STD_LOGIC
  );
end RAM_16X1_DISTRIBUTED;
```

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.17

RAM 16x1 (cont.)

```
architecture RAM_16X1_DISTRIBUTED_STRUCTURAL of RAM_16X1_DISTRIBUTED is
```

```
-- part used by the synthesis tool, Synplify Pro, only; ignored during simulation
  attribute INIT : string;
  attribute INIT of RAM16X1_S_1 : label is "0000";
```

```
  component ram16x1s
    generic(
      INIT : BIT_VECTOR(15 downto 0) := X"0000");
    port(
      O : out std_ulogic;
      A0 : in std_ulogic;
      A1 : in std_ulogic;
      A2 : in std_ulogic;
      A3 : in std_ulogic;
      D : in std_ulogic;
      WCLK : in std_ulogic;
      WE : in std_ulogic);
  end component;
```

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.18

RAM 16x1 (cont.)

```
begin
  RAM_16X1_S_1: ram16x1s generic map (INIT => X"0000")
  port map
    (O => DATA_OUT,
     A0 => ADDR(0),
     A1 => ADDR(1),
     A2 => ADDR(2),
     A3 => ADDR(3),
     D => DATA_IN,
     WCLK => CLK,
     WE => WE
    );
end RAM_16X1_DISTRIBUTED_STRUCTURAL;
```

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.19

Writing Synthesizable Code

- For combinational logic, use only concurrent statements
 - Concurrent signal assignment (\leftarrow)
 - Conditional concurrent signal assignment (when-else)
 - Selected concurrent signal assignment (with-select-when)
 - Generate scheme for equations (for-generate)

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.20

Writing Synthesizable Code (cont.)

- For circuits composed of
 - Simple logic operations (logic gates)
 - Simple arithmetic operations (addition, subtraction, multiplication)
 - Shifts/rotations by a constant
- Use concurrent signal assignment (\leftarrow)

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.21

Writing Synthesizable Code (cont.)

- For circuits composed of
 - Multiplexers
 - Decoders, encoders
 - Tri-state buffers
- Use
 - Conditional concurrent signal assignment (when-else)
 - Selected concurrent signal assignment (with-select-when)

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.22

Left-Side v. Right-Side of Assignment

Left side \leftarrow **Right side**
 \leftarrow when-else
 with-select \leftarrow

- Internal signals (defined in a given architecture)
- Ports of the mode
 - out
 - inout
 - buffer

Expressions including:

- Internal signals (defined in a given architecture)
- Ports of the mode
 - in
 - inout
 - buffer

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.23

Arithmetic Operations

- Synthesizable arithmetic operations:
 - Addition, +
 - Subtraction, -
 - Comparisons, >, >=, <, <=
 - Multiplication, *
 - Division by a power of 2, /2**6 (equivalent to right shift)
 - Shifts by a constant, SHL, SHR

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.24

Arithmetic Operations (cont.)

- The result of synthesis of an arithmetic operation is a
 - Combinational circuit
 - Without pipelining
- The exact internal **architecture** used (and thus delay and area of the circuit) may depend on the **timing constraints** specified during synthesis (e.g., the requested maximum clock frequency)

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.25

Operations on Numbers

- For operations on unsigned numbers
 - USE ieee.std_logic_unsigned.all**
 - Signals (inputs/outputs) of the type **STD_LOGIC_VECTOR**
 - Or, **USE ieee.std_logic_arith.all**
 - Signals (inputs/outputs) of the type **UNSIGNED**
- For operations on signed numbers
 - USE ieee.std_logic_signed.all**
 - signals (inputs/outputs) of the type **STD_LOGIC_VECTOR**
 - Or, **USE ieee.std_logic_arith.all**
 - Signals (inputs/outputs) of the type **SIGNED**
- Signed / Unsigned types behave exactly like **STD_LOGIC_VECTOR**
 - Also determine whether the number should be treated as a signed or unsigned number

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.26

Representing Integers

- Operations on signals (variables) of the integer types (**INTEGER**, **NATURAL**) and their subtypes are synthesizable in the range:
 - $[-(2^{31}-1) \dots 2^{31}-1]$ for **INTEGERs** and their subtypes
 - $[0 \dots 2^{31}-1]$ for **NATURALS** and their subtypes
- Operations on the integer types are less flexible and more difficult to control than operations **STD_LOGIC_VECTOR** and are recommended to be avoided by beginners

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.27

Addition of Signed Numbers

```

LIBRARY ieee ;
USE ieee.std_logic_1164.all ;
USE ieee.std_logic_signed.all ;

ENTITY adder16 IS
    PORT ( Cin           : IN    STD_LOGIC ;
          X, Y           : IN    STD_LOGIC_VECTOR(15 DOWNTO 0) ;
          S              : OUT   STD_LOGIC_VECTOR(15 DOWNTO 0) ;
          Cout, Overflow : OUT   STD_LOGIC ) ;
END adder16 ;

ARCHITECTURE Behavior OF adder16 IS
    SIGNAL Sum : STD_LOGIC_VECTOR(16 DOWNTO 0) ;
    BEGIN
        Sum <= ('0' & X) + Y + Cin ;
        S <= Sum(15 DOWNTO 0) ;
        Cout <= Sum(16) ;
        Overflow <= Sum(16) XOR X(15) XOR Y(15) XOR Sum(15) ;
    END Behavior ;

```

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.28

Addition of Signed Numbers (cont.)

```

LIBRARY ieee ;
USE ieee.std_logic_1164.all ;
USE ieee.std_logic_arith.all ;

ENTITY adder16 IS
    PORT ( Cin           : IN    STD_LOGIC ;
          X, Y           : IN    SIGNED(15 DOWNTO 0) ;
          S              : OUT   SIGNED(15 DOWNTO 0) ;
          Cout, Overflow : OUT   STD_LOGIC ) ;
END adder16 ;

ARCHITECTURE Behavior OF adder16 IS
    SIGNAL Sum : SIGNED(16 DOWNTO 0) ;
    BEGIN
        Sum <= ('0' & X) + Y + Cin ;
        S <= Sum(15 DOWNTO 0) ;
        Cout <= Sum(16) ;
        Overflow <= Sum(16) XOR X(15) XOR Y(15) XOR Sum(15) ;
    END Behavior ;

```

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.29

Addition of Signed Numbers (cont.)

```

ENTITY adder16 IS
    PORT ( X, Y           : IN    INTEGER RANGE -32768 TO 32767 ;
          S              : OUT   INTEGER RANGE -32768 TO 32767 ) ;
END adder16 ;

ARCHITECTURE Behavior OF adder16 IS
    BEGIN
        S <= X + Y ;
    END Behavior ;

```

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.30

Combinational Logic using Processes

Rules that need to be followed:

1. All inputs to the combinational circuit should be included in the sensitivity list
2. No other signals should be included in the sensitivity list
3. None of the statements within the process should be sensitive to rising or falling edges
4. All possible cases need to be covered in the internal **IF** and **CASE** statements in order to avoid implied latches

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.31

Covering the IF Statement

Using ELSE

```
IF A = B THEN
    AeqB <= '1' ;
ELSE
    AeqB <= '0' ;
```

Using default values

```
AeqB <= '0' ;
IF A = B THEN
    AeqB <= '1' ;
```

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.32

Covering the CASE Statement

Using WHEN OTHERS

```
CASE y IS
    WHEN S1 => Z <= "10";
    WHEN S2 => Z <= "01";
    WHEN OTHERS => Z <= "00";
END CASE;
```

```
CASE y IS
    WHEN S1 => Z <= "10";
    WHEN S2 => Z <= "01";
    WHEN S3 => Z <= "00";
    WHEN OTHERS => Z <= "--";
END CASE;
```

Using default values

```
Z <= "00";
CASE y IS
    WHEN S1 => Z <= "10";
    WHEN S2 => Z <= "10";
END CASE;
```

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.33

Initializations

- Declarations of signals (and variables) with initialized values, such as
SIGNAL a : STD_LOGIC := '0';
- Cannot be synthesized, and thus should be avoided
- If present, they will be ignored by the synthesis tools

- Use set and reset signals instead

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.34

Variables – Example

```
LIBRARY ieee ;
USE ieee.std_logic_1164.all ;

ENTITY Numbits IS
    PORT ( X      : IN  STD_LOGIC_VECTOR(1 TO 3) ;
          Count  : OUT INTEGER RANGE 0 TO 3) ;
END Numbits ;
```

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.35

Variable – Example (cont.)

```
ARCHITECTURE Behavior OF Numbits IS
BEGIN
    PROCESS(X) – count the number of bits in X equal to 1
        VARIABLE Tmp: INTEGER;
    BEGIN
        Tmp := 0;
        FOR i IN 1 TO 3 LOOP
            IF X(i) = '1' THEN
                Tmp := Tmp + 1;
            END IF;
        END LOOP;
        Count <= Tmp;
    END PROCESS;
END Behavior ;
```

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.36

Variables – Features

- Can only be declared within processes and subprograms (functions & procedures)
- Initial value can be explicitly specified in the declaration
- When assigned take an assigned value immediately
- Variable assignments represent the desired behavior, not the structure of the circuit
- Should be avoided, or at least used with caution in a synthesizable code

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.37

Variables vs. Signals

```

LIBRARY IEEE;
USE IEEE.STD_LOGIC_1164.all;

ENTITY test_delay IS
  PORT(
    clk : IN STD_LOGIC;
    in1, in2 : IN STD_LOGIC;
    var1_out, var2_out : OUT STD_LOGIC;
    sig1_out : BUFFER STD_LOGIC;
    sig2_out : OUT STD_LOGIC
  );
END test_delay;
    
```

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.38

Variables vs. Signals (cont.)

```

ARCHITECTURE behavioral OF test_delay IS
BEGIN
  PROCESS(clk) IS
    VARIABLE var1, var2: STD_LOGIC;
  BEGIN
    if (rising_edge(clk)) THEN
      var1 := in1 AND in2;
      var2 := var1;

      sig1_out <= in1 AND in2;
      sig2_out <= sig1_out;
    END IF;

    var1_out <= var1;
    var2_out <= var2;
  END PROCESS;
END behavioral;
    
```

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.39

Simulation Result

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.40

Assert Statements

- Assert is a **non-synthesizable** statement whose purpose is to write out messages on the screen when problems are found during simulation
- Depending on the **severity of the problem**, the simulator is instructed to continue simulation or halt
- Syntax:
 - ASSERT condition [REPORT "message"] [SEVERITY severity_level];
 - The message is written when the condition is FALSE
 - Severity_level can be: Note, Warning, Error (default), or Failure

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.41

Array Attributes

A'left(N)	left bound of index range of dimension N of A
A'right(N)	right bound of index range of dimension N of A
A'low(N)	lower bound of index range of dimension N of A
A'high(N)	upper bound of index range of dimension N of A
A'range(N)	index range of dimension N of A
A'reverse_range(N)	index range of dimension N of A
A'length(N)	length of index range of dimension N of A
A'ascending(N)	true if index range of dimension N of A is an ascending range, false otherwise

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.42

Subprograms

- Include **functions** and **procedures**
- Commonly used pieces of code
- Can be placed in a library, and then reused and shared among various projects
- Use only sequential statements, the same as processes
- Example uses:
 - Abstract operations that are repeatedly performed
 - Type conversions

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.43

Functions – Basic Features

- Always return a single value as a result
- Are called using formal and actual parameters the same way as components
- Never modify parameters passed to them
- Parameters can only be constants (including generics) and signals (including ports);
- Variables are not allowed; the default is a CONSTANT
- When passing parameters, no range specification should be included (for example no RANGE for INTEGERS, or TO/DOWNTO for STD_LOGIC_VECTOR)
- Are always used in some expression, and not called on their own

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.44

Function Syntax and Example

```
FUNCTION function_name (<parameter_list>
RETURN data_type IS
  [declarations]
BEGIN
  (sequential statements)
END function_name;
```

```
FUNCTION f1
(a, b: INTEGER; SIGNAL c: STD_LOGIC_VECTOR)
RETURN BOOLEAN IS
BEGIN
  (sequential statements)
END f1;
```

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.45

Procedures – Basic Features

- Do not return a value
- Are called using formal and actual parameters the same way as components
- May modify parameters passed to them
- Each parameter must have a mode: IN, OUT, INOUT
- Parameters can be constants (including generics), signals (including ports), and variables
- The default for inputs (mode in) is a constant, the default for outputs (modes out and inout) is a variable
- When passing parameters, range specification should be included (for example RANGE for INTEGERS, and TO/DOWNTO for STD_LOGIC_VECTOR)
- Procedure calls are statements on their own

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.46

Procedure Syntax and Example

```
PROCEDURE procedure_name (<parameter_list> IS
  [declarations]
BEGIN
  (sequential statements)
END procedure_name;
```

```
PROCEDURE p1
(a, b: in INTEGER; SIGNAL c: out STD_LOGIC_VECTOR)
  [declarations]
BEGIN
  (sequential statements)
END p1;
```

October 25, 2007

CprE 583 – Reconfigurable Computing

Lect-19.47
